HEAT FAB SAF-T VENT CI PLUS

ONE INCH AIRSPACE PLUS FASTER INSTALLATION

For boiler and water heater installations that require an AL29-4C venting product, **Heat Fab Saf-T Vent CI Plus** provides the double wall venting necessary to meet codes and reduces the required airspace to combustibles while reducing installation time. The **Saf-T Vent CI Plus** utilizes the "Sure Seal" Closure System. Heat Fab states on their website "Heat Fab has taken its proven tapered connection and added a new closure ring that actually draws the joint together. The built in commercial grade silicone gasket provides a seal able to fully withstand the increased pressures and stresses of today's high efficiency appliances."

Because of the built in silicon gasket, the Saf-T Vent CI Plus installation time is much reduced from the systems requiring application of silicon sealing adhesive dispensed from a tube. Typically the higher cost of the CI Plus product is more than offset with reduced installation labor cost.

Another benefit with the Saf-T Vent CI Plus product is the reduced clearance to combustibles. The one inch airspace provides for a reduction from 4" clearance to 1" clearance is vent sizes to 24" diameter based upon a maximum flue gas temperature of 550 deg. Fahrenheit.

The outer jacket of the product is bright 430 stainless steel which needs no painting to protect it from the elements whether inside or outside the building. The 430 stainless steel maintains its shiny appearance for years and gets positive comments about how great the installation looks.
